

ECON4061 Machine Learning in Economics

Module Outline

Instructor: Marit Hinnosaar

Autumn 2025

Lectures: 10 2-hour sessions, at Monica Partridge D04; Thu 9-11am

Computer classes: 8 1-hour sessions in October & November, at Hallward LG101, Tue 12-1pm

Office hour sign-up:

Module aims and objectives

The module introduces students to Machine Learning and the analysis of large datasets in economics. Vast amounts of unstructured data have become available, especially because many production and consumption activities leave digital footprints. Machine Learning algorithms provide powerful tools for analyzing such data. The module focuses on using Machine Learning to generate new data in economics. In particular, it demonstrates how to create structured data from unstructured sources such as text or images. This enables economists to provide better answers to long-standing questions and to address new ones that could not be answered before. The module teaches coding in Python and provides basic knowledge and hands-on practice in implementing Machine Learning algorithms, including Large Language Models. The module gives an introduction to those methods, applies these to real-world datasets, and discusses applications and current academic research that illustrate their use in economics.

Assessment

The assessment consists of group coursework and in-person closed book written 2-hour exam. The exam gives 75% of the mark in the module, group coursework gives 25%. Specifically, group coursework presentation gives 15%, and group coursework essay gives 10% of the final mark. The exam will take place during the Autumn examination period in January. Group courseworks are presented in the last three weeks of the module during lecture times. The deadline for the group coursework essay is Friday, December 12, 2025 at 15:00.

Tentative schedule of lectures and corresponding references

1. Introduction and overview of the module
2. Basic methods in Natural Language Processing: dictionaries, dictionary-based sentiment analysis, cosine similarity, applications in economics

Tentative schedule of computer classes

1. Introduction to Python (assigning values, logical operators and conditionals, lists and indexing, loops, defining functions), Jupyter Notebooks, Pandas, importing and exporting data, taking a look at the data, data aggregation in Pandas, summary statistics, data visualization
2. Regular expressions, dictionaries, sentiment analysis
3. Cosine similarity
4. Word embeddings, Word2vec
5. Large Language Models for text summarization and information extraction
6. Transformer-based models to work with text and images
7. Model fine-tuning
8. Review
